Institution: UNIVERSITY INSTITUTE OF
COMPUTING

Project Guide: Mr. Vinod Bagga

Date of Submission: 6, November 2025

Abstract

The **Tour Booking Website** is a dynamic web-based application designed to simplify the process of travel planning, package selection, and tour booking for users. Developed using the **Laravel PHP Framework**, this system integrates essential web technologies such as **HTML, CSS, JavaScript, MySQL, and APIs** to deliver an efficient and user-friendly online travel experience. The main objective of this project is to automate the traditional manual process of tour booking and bring it online through a centralized web portal. Users can browse available destinations, check package details, book tours, and simulate online payments. Administrators can add, edit, and manage packages, handle bookings, and view customer feedback.

The project successfully demonstrates **session management, authentication, payment simulation, and review management**, creating a complete web development case study relevant to modern travel technology.

Introduction

With the rise of digital technologies, the travel and tourism industry has shifted toward online booking systems. Users increasingly rely on websites to plan and book trips conveniently without visiting physical travel offices.

Traditional booking methods often involve manual record keeping, phone calls, and delayed confirmations. The **Tour Booking Website** solves these inefficiencies by enabling an automated system where users and admins can manage all travel-related operations through an interactive interface.

Key Technologies Used:

- **Frontend:** HTML5, CSS3, Bootstrap, JavaScript
- **Backend:** Laravel Framework (PHP)
- **Database:** MySQL
- **APIs:** Google Maps and Razorpay test API for simulation
- **Server:** Apache (XAMPP)

This web application implements **authentication, session handling, and dynamic database-driven features** to create a professional-grade travel booking platform.

Problem Statement and Objectives

Problem Statement

In manual travel booking systems, users face issues such as:

- Difficulty accessing real-time tour details.
- Dependence on agents for bookings.
- Lack of instant confirmation or digital payment records.

To overcome these, the proposed system aims to automate and digitize the process of tour booking through a secure and interactive website.

Objectives

1. Develop a dynamic online platform for tour and travel bookings.
2. Implement secure **user authentication and admin management**.
3. Integrate **session-based management and simulated payments**.
4. Enable **tour package creation, editing, and booking confirmation**.

5. Allow users to provide **ratings and reviews** for tours.

System Design / Approach

5.1 System Architecture

The website follows the **MVC (Model-View-Controller)** architecture in Laravel:

- **Model:** Handles data interaction with MySQL.
- **View:** Displays front-end pages to the user.
- **Controller:** Processes user requests and links the model and view.

5.2 System Flow

Step 1: User registers or logs in.

Step 2: System authenticates and initiates session.

Step 3: User views tour packages.

Step 4: User books a tour and proceeds to payment simulation.

Step 5: Confirmation and review submission.

5.3 Data Flow Diagram (DFD)

Level 0: User ↔ Website ↔ Database

Level 1:

- User requests → Controller → Model → Data fetched → View displayed.
- Booking details → Stored in database → Confirmation returned to user.

5.4 Entity Relationship (ER) Diagram

Entities:

- User (UserID, Name, Email, Password)
- Tour (TourID, Destination, Price, Description)
- Booking (BookingID, UserID, TourID, PaymentStatus)
- Review (ReviewID, UserID, TourID, Rating, Comment)

Relationships:

- One user can make multiple bookings.
- One booking belongs to one tour.
- Each booking can have one review.

5.5 Database Schema

Table	Columns	Description
users	id, name, email, password	Stores registered users
tours	id, title, description, price, image	Stores available tour packages
bookings	id, user_id, tour_id, payment_status, date	Stores booking details
reviews	id, user_id, tour_id, rating, comment	Stores user reviews

Implementation

6.1 Tools and Setup

- **Framework:** Laravel 10.x
- **IDE:** Visual Studio Code
- **Server Environment:** XAMPP
- **Database Tool:** phpMyAdmin

6.2 Code Structure

```
/project_root
```

```
-- app/
```

Http/

Controllers/

```
| | | | — TourController.php
```

```
| | | | — BookingController.php
```

```
| | | └─ ReviewController.php
```

```
| -- resources/views/
```

| — home.blade.php

| — booking.blade.php

```
| └─ admin.blade.php
```

```
-- routes/web.php
```

```
-- database/migrations/
```

```
-- public/css, js, images/
```

6.3 Sample Route (web.php)

```
Route::get('/', [TourController::class, 'index']);  
Route::get('/book/{id}', [BookingController::class,  
'create']);  
Route::post('/book', [BookingController::class,  
'store']);  
Route::post('/review', [ReviewController::class,  
'store']);
```

```
Route::get('/', [TourController::class, 'index']);  
Route::get('/book/{id}', [BookingController::class,  
'create']);  
Route::post('/book', [BookingController::class, 'store']);  
Route::post('/review', [ReviewController::class, 'store']);
```

6.4 Booking Controller (Snippet)

```
public function store(Request $request) {  
    $booking = new Booking();  
    $booking->user_id = Auth::id();  
    $booking->tour_id = $request->tour_id;  
    $booking->payment_status = 'Simulated';  
    $booking->save();  
    return redirect('/dashboard')->with('success',  
'Tour booked successfully!');  
}
```

6.5 Authentication

Laravel Breeze or Passport is used for login, registration, and password hashing.

Session management ensures only authenticated users can book or review tours.

```
pp artisan serve
```

```
Laravel development server started
```

```
Access http://17.0.0.1:8000
```

```
Press Ctrl+C to stop the server.
```

Results / Testing

7.1 Functional Testing

Test Case	Description	Expected Output	Result
User Login	Valid credentials	Redirect to dashboard	Pass
Add Tour	Admin adds new package	Display on homepage	Pass
Book Tour	User books selected package	Booking confirmation	Pass
Simulate Payment	Test transaction	Success message	Pass
Review Tour	Submit review	Stored in database	Pass

7.2 Screenshots (to insert later)

- Homepage showing available tours.
- Login & Registration page.
- Admin dashboard (Add/Edit Packages).
- Booking confirmation screen.
- Payment simulation page.

Conclusion

The **Tour Booking Website** provides a complete, secure, and efficient online travel booking experience. The system simplifies both user and admin tasks by integrating essential web technologies like Laravel, MySQL, and Bootstrap.

The project demonstrates proficiency in:

- **Laravel MVC structure and CRUD operations**
- **Session management and authentication**
- **Payment simulation integration**
- **Database connectivity and responsive design**

This project not only fulfills academic requirements but also showcases a real-world application of modern web development techniques.

Future Scope

- Integration of live payment gateways (PayPal, Razorpay).
- Development of a mobile application using React Native.
- Inclusion of hotel and transport booking features.
- Multilingual support and chatbot assistance.
